

ROTEX® GS clamping ring hubs light

09/2009

KTR as a specialist for couplings pays special attention to the demands and special requirements of the market of drive technology by permanently extending the production programme. In the range of backlash-free shaft couplings **ROTEX® GS light** is one of these extensions of the programme.

The **ROTEX® GS light** clamping ring hub differs from the previous design mainly since it is fully made from aluminium. In this way the weight of **ROTEX® GS light** is considerably reduced and its mass moments of inertia are lower than those of the well-known design comprising a steel ring by $2/3$.

Another feature is an easier assembly. Through a block assembly you can achieve the defined tightening torque of the inner clamping screws in a faster way.

You can only benefit from our **ROTEX® GS light** and this also from the cost point of view!

KTR Kupplungstechnik GmbH will present this new product along with other important new products on the occasion of this year's MOTEK in Stuttgart (taking place from 21.-24.09.2009, hall 9 / booth 9230) and the EMO in Milan (taking place from 05.-10.10.2009, hall 3P / booth H08). It will be best if you visit the KTR engineers locally and have a look at these and other important details on the Internet at www.ktr.com.
